Profit Driven Client Targeting

How Amundi Can Increase Profit from Weekly Client Outreach

The Problem: Precision at Scale

7,700 leads, 1,200 slots - Every wrong decision has a measurable price.

7,700

Total Weekly Leads

Each week, 7,700 prospective clients arrive from the partner bank's CRM system

1,200

Operational Capacity

The team can realistically reach out to no more than 1,200 clients in any given week

€5.00 / call

Direct Cost

Each outreach attempt costs the firm in direct marketing and advisory time - win or lose

~€22 / missed

Opportunity Cost

Amundi earns 4.5% commission on invested amounts
A missed investor means lost revenue every time

The key is choosing the right clients to contact

Our Framework: "Willingness × Wealth"

Creating a ranked profit approach by using Classification and Regression models.

	Database	Classification	Regression	Combined
Goal	7,700 raw leads	Who will invest?	How much?	Top by E[Profit]
Process	Data exploration	Train 7 models	Train 6 models	Multiply P(invest) x E(Amount)
	Preprocessing Pipeline	Compare on ROC-AUC, Recall and LogLoss	Compare on RMSE & R^2	Rank leads by E[Profit]
	Create stratified test/training sets	Select best classification model	Select best regression model	Select top leads

Who Will Invest?

We evaluated 7 different models to identify which clients are most likely to invest

How well do we spot opportunities?

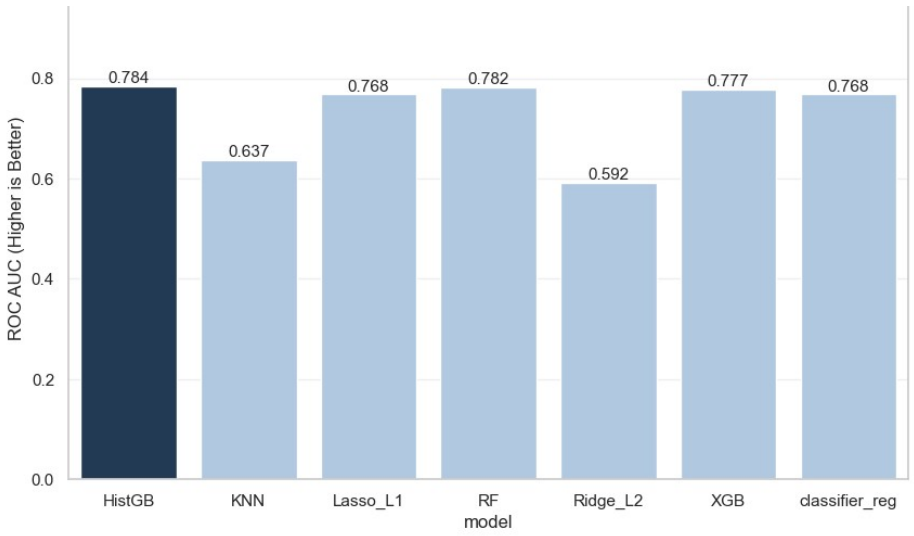

Random Forest best identifies who invests

Who Will Invest?

Random Forest is the most reliable model and finds the most investors

How well do we spot opportunities?

Random Forest (RF)

AUC = 0.78 → RF correctly identifies the right opportunity 78% of the time

Recall = 69.1% → RF catches 69.1% of all investors

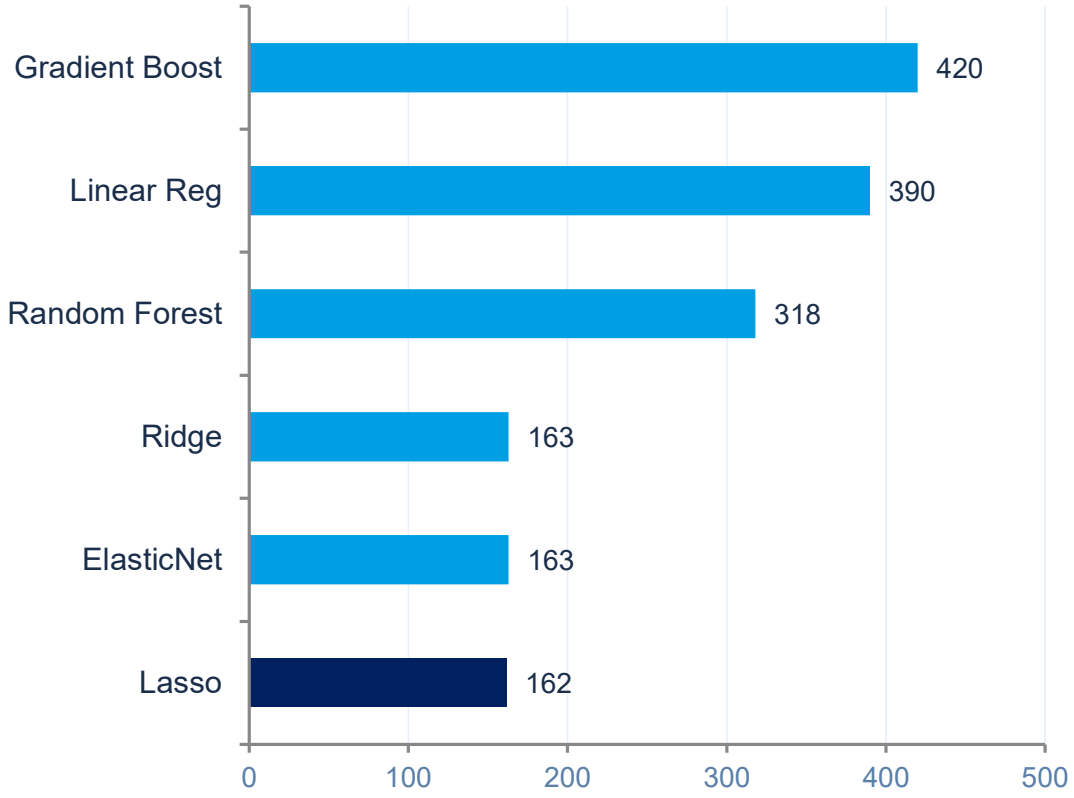

LogLoss = 0.37 → RF predictions are 0.367 confident and correct

Random Forest best identifies who invests

How Much Will They Invest?

Lasso Model predicts best how much clients invest

RMSE BY MODEL - SORTED LOW TO HIGH (€, LOWER IS BETTER)

Best Model: Lasso

RMSE

€162

On average, predictions are off by €162. Lower is better — 0 would be perfect.

R^2 SCORE

0.94

The model explains 94.2% of the variation in investment amounts. Closer to 1.0 is better.

Customer Selection: Profit Calculation

Leveraging both models maximizes profit forecast accuracy

Calibrated RF		Lasso Regressor		Front-end		Per Call		per call (avg.)
P(invest)	×	**E(Amount)**	×	**Commission**	−	**Cost**	=	**E[Profit]**
30.6%		**€1,057**		**4.5%**		**5€**		**€6.77**

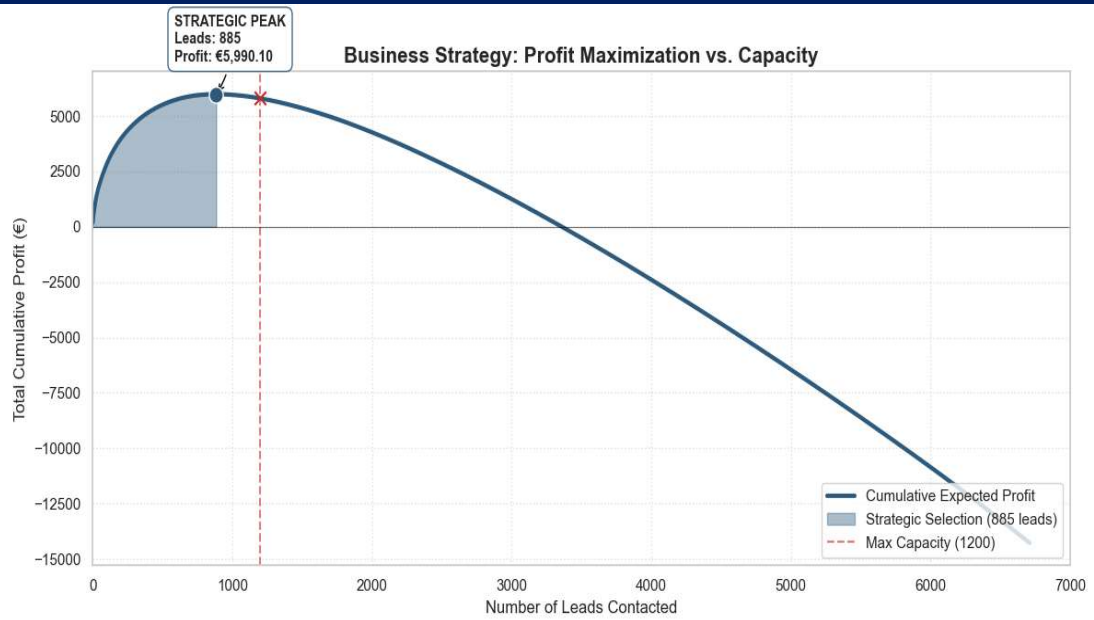

Insight: A **high-probability client** with a **modest balance** may rank below a **moderate-probability client** with a **very high balance**. Targeting by **Expected Profit,** not probability alone, is what **creates Value.**

Expected Profit Curve

Call efficiency over capacity: staying below 1,200 to protect margins

Amundi
Investment Solutions

Profit by number of calls

Avg. Invest Probability

Accuracy of our predictions

Call efficiency over capacity: staying below 1,200 to protect margins

Expected vs Actual Profit by Period

- 94.4% forecast accuracy in Period 4 (projected €6,353, delivered €5,998).
- 75.7% forecast accuracy in Period 5, the 24.3% gap is explained by the smaller and different client pool (6,711 vs 7,700).

Why our model generates profit

Same 885 calls. Same week. Completely different outcome.
